                                                                                                                                                                                                                                                          probes which are derived from genomic sequences expressed in the human
bone marrow. They can be used to measure gene expression in bone marrow
samples, which may enable the improved diagnosis and treatment of cancers
such as lymphoma, leukaemia and myeloma. The present sequence is a
protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                    Human genome-derived single exon nucleic acid probes useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    STRAP-expressing cells. STRAP proteins may be used to identify specific-binding agents, to produce anticancer vaccines and to generate specific antibodies. The antibodies may be used for detection, prognosis, and monitoring of cancers (or susceptibility to cancer), as therapeutic inhibitors or to target therapeutic agents to their site of action. STRAP nucleic acids may be used for recombinant protein production, as diagnostic and prognostic respents, for identifying STRAP-expressing cells for screening inhibitors of STRAP expression and for herapeutic modulation/inhibition of STRAP expression. Since high levels of STRAP proteins are exposed on the cell surface, they are easily targetted by systemically administered agents, and because they are expressed mainly on prostatic spithelial cells, agents targetted to them should have minimal side effects on other tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        09-MAY-2000;

The invention relates to isolated prostate-specific polymuleotides, polymeptides, service in service in the polymeptides, antibodies raised against the polymeptides (or antigenic epitopes

The invention relate so polynucleotides (ANXS1456-ANXS343) and the encoded polypeptides (ANYS321-ANMS302) that exhibit activity elating trytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or polynucleotides and polypeptides are useful in gene therapy.

ö

Nucleic acids encoding polypeptides with cytokine-like activities, useful in diagnosis and gene therapy -

The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polymocleotides and the antigen-presenting cells are useful for attumbating and/or expanding T cells specific for a tumbus procein, and for inhibiting the development of cancer especially prostate concer. Compositions comprising the polymocleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The obsquare belief is useful for etecting cancer, The present sequence is a prostate specific
                                                                                                                                                                                             Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorder; arthritis; inflammation.

The present invention describes polymucleotide sequences (I) which encode prostate-specific protectins (II), (II) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), and because to (II), fusion protects comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is disposed or treated is particularly prostate cancer. (I) and (II) can be used for wontioring the progression of cancer in a patient. (I) and (II) can be used for monitoring the progression of cancer in a patient. (I) and (II) can be used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to improve dispositic and therapeutic methods for postate cancer. They can indicate the level of metastasis as well as the prostate volume. AMH93357 to AMH93944 and AMM01115 to AMM01118 represent polymucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Kalos MD,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polynucleotide encoding a prostate-specific protein, diagnosing, monitoring and treating prostate cancer in a for use in vaccines -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
           The present invention relates to methods of detecting a prostate cancer associated transcript in a cell from a parient. The method comprises contacting a biological sample from the patient with prostate cancer-associated polymicleorides (designated PC genes) that prostate cancer-associated polymicleorides (designated PC genes) that contact the prostate cancer-associated polymicleoride sequences to them. The prostate cancer-associated polymicleoride sequences are differentially expressed in prostate tumour tissue or in prostate cancer and are derived from the tissues of various or prostate cancer and are derived from the tissues of various and one of the invention are useful for diagnosing and treating prostate cancer. The machods or treating prostate cancer-associated genes are useful for diagnosing or treating prostate cancers, as well as for useful for diagnosing or treating prostate cancer that inhibit prostate cancer. The nucleic acid sequences are particularly useful in gene therapy, as vaccine or in antisense applications.

20 ABG61800-ABG61944 represent prostate cancer-associated proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides prostate-specific coding sequences and their encoded proteins. These can be used in the diagnosis and treatment of cancers, particularly prostate cancer. The present sequence is a protein described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New prostate-specific polynuclectides for diagnosing and treating disease, in particular prostate cancer, and as markers for the progression of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Xu J, Dillon DC, Mitcham JL, Harlocker SL, Jiang Y,

The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hemanopodesis regulating e.g. stem cell growth factor activity, hemanopodesis regulating activity issue growth factor activity, hemanopodesis regulating activity tand may be useful in the diagnosis and/or restment of cancer, leukaemia, nervous system disorders, arthritis and

The present sequence is human six transmembrane epithelial antigen of Ct the prostate (STEAP)-1 protein of clone 10. STEAP is a member of cell curiace serpentine transmembrane antigens. STEAP-1 gene is located on Ct chromosome 7p22.3 and is used in gene therapy. Inhibiting the development CC on progression of a cancer (eg. prostate, colon, bladder, lung, ovarian CC and pancreatic) expressing STEAP or inhibiting growth or killing cells expressing STEAP, comprises administering a vaccine CC expresses STEAP, or inhibiting growth or xilling cells expressing STEAP, comprises the variable domains of the heavy and composition to the patient. Treating a patient with a concer that CC composition antibody that comprises the variable domains of the heavy and composition to the monoclonal antibody that specifically binds to STEAP, comprises the variable domains of the heavy and complied that the vector delivers the single chain monoclonal antibody coding could be sequenced to the cancer cells and the encoded single chain monoclonal control of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patient of the patie

CC human secreted protesins, and encode the protesins given in AAV1251 to CC having the respectively. The protesins given represent the signal peptide and an N-terminal fragment of a secreted human gene products. They come also be used to develop producing secreted human gene products. They can also be used to develop producing secreted human gene products. They come in the protesins obtained may have cyrokine activity, call and therapy. The composition of the protesins of the products for disapposis and therapy. The composition of the protesing activity, the products of the products of the products of the products of the products of the products of the products of the products of the products of the products of the products of the products of the sequences can also be used for obtaining corresponding promoters can be used in foreign encoding the signal peptide on be used for discriming extracellular secretion of a polypeptide or the insertion of a polypeptide or the products.

PATENT NO. 6329503

GENERAL INFORMATION:

APPLICANT: Maniel E. Afar

APPLICANT: Rene S. Habert

APPLICANT: Anthur B. Raitano

APPLICANT: Athur B. Raitano

APPLICANT: Steve Chappell Mitchell

APPLICANT: Steve Chappell Mitchell

APPLICANT: Steve Chappell Mitchell

TITLE OF INVENTION: NOVEL SERREBNINE TRANSMEMBANE ANTIGENS

TITLE OF INVENTION: EXPRESSED IN HUMAN CANCERS AND USES THEREOF

FILE REFERENCE: 129 16USIT: 1990-66-10

FILOR APPLICATION NUMBER: 60/087,520
